## Bit and Joint Specification

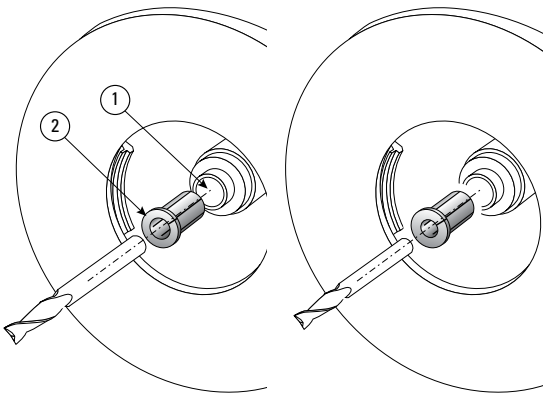

## Bit Selection and Joint Specification

Virtually any straight router bit may be used for routing box joints or finger joints. There are two types which each have their own advantages and disadvantages. Generally, the high-speed steel (HSS) spiral upcut bits cut cleaner and have less tendency to cause tear-out. They also tend to pull the waste chips up to and around the guidebush, necessitating the occasional cleaning of the guide surfaces. Straight-flute carbide tipped bits spray the waste out horizontally, but they do not cut quite as cleanly.

“A” is the bit diameter and equals the nominal size of the finger or socket.

“B” is the cutting depth or board thickness, whichever is less.

Check the shank size of each bit selected, then use the appropriate collet ① or collet reducer ②. 1/4" collet reducers come standard with most 1/2" collet routers, but **if 5/16", 8mm or 3/8" collets are not available, use one of the following:**

For all 3/8" shank bits use the Leigh No. 172-375, 1/2" to 3/8" collet reducer.

For all 5/16" and 8mm shank bits (*these are almost the same diameter*), use Leigh No. 172-8, 1/2" to 8mm collet reducer.

*See the next page for Bit Selection and Joint Specification charts.*
